STRATEGY

Reporting Strategy & KPI Framework

From Odoo to CEO Dashboard — One Version of the Truth

PRINCIPLES
One version of the truth
Data stewardship
Fix at the source

ARCHITECTURE
7 sources → Fabric Data Factory → Lakehouse → Power BI

KPIS
6 families, 40+ KPIs
Steward per family
Drill-down by analytics

Kebony — All Entities | March 2026

Status: Strategy proposal · For CEO review

1. One Version of the Truth

The foundational principle: every number in every report traces back to one authoritative source

THE PROBLEM TODAY

- ✕ Multiple spreadsheets with conflicting numbers
- ✕ Manual reports rebuilt monthly from raw exports
- ✕ Different people calculate the same KPI differently
- ✕ No clear ownership of data quality
- ✕ Cutoff issues: “is this invoice included or not?”
- ✕ Shadow reporting: Excel files that nobody else can read

THE PRINCIPLE

- ✓ **One source** — Odoo is the system of record for all business data
- ✓ **One extraction path** — automated, scheduled, auditable
- ✓ **One BI layer** — all reports from the same data set
- ✓ **One definition** — each KPI has exactly one formula, one steward

THE FLOW (MICROSOFT FABRIC)

```
SOURCE            PREP & INGEST       LAKEHOUSE         VISUALISE
Odoo 19      →                      Bronze (raw)
Prediktor    →   Fabric Data      ↓
Salesforce   →   Factory       →  Silver (validated)  →  Power BI
D365 / Perfion→                       ↓
AX2012       →                       Gold (enriched)
WordPress    →
```

The Cardinal Rule

If a number is wrong, **fix it at the source** (Odoo or Prediktor) — never in the report, never in the ETL, never in an Excel override. The BI layer is **read-only truth**.

No business logic in the BI layer. KPI definitions live in the ETL or in Odoo itself. Dashboard formulas only do presentation (formatting, filtering, drill-down). This prevents “magic formulas” that only one person understands.

2. Data Stewardship — Who Owns the Numbers

A Data Steward is accountable for a KPI's definition, data quality, and cutoff rules. It is a business role, not an IT role.

THE FOUR RESPONSIBILITIES

RESPONSIBILITY	WHAT IT MEANS	EXAMPLE
Definition	What does the KPI measure? What is the formula? What is included / excluded?	"Net Revenue = posted invoices – credit notes, in entity currency"
Source	Where does the raw data come from? Which Odoo model, which Prediktor tag?	"account.move where type = out_invoice, state = posted"
Quality	Is the data complete, timely, accurate? Are there gaps or duplicates?	"Check for unposted draft invoices at M+5"
Cutoff	When is data final? What is the closing calendar? What can change after close?	"Revenue final at M+5 working days. COGS final after GRNI cleared."

Cutoff is the #1 cause of conflicting numbers. Two people pulling the same report on different dates get different results. The steward defines *when* a KPI becomes official — before that, it's a preliminary estimate.

WHO IS THE STEWARD?

KPI FAMILY	STEWARD	WHY THEM
Commercial	Sales Director	Owns revenue targets, customer relationships, pricing
Margin	CFO	Owns P&L structure, COGS methodology, accrual rates
Production	Operations Director	Owns output targets, yield, OEE, process parameters
Supply Chain	Logistics Manager	Owns OTIF, lead times, inventory policy
Working Capital	CFO	Owns cash cycle, AR/AP policy, inventory valuation
People	HR / Ops Director	Owns headcount, productivity targets

The Steward Is NOT the Data Entry Person

The steward doesn't enter invoices or close MOs. They are accountable for the KPI being **correctly defined**, **correctly sourced**, and **correctly reported**. If a KPI is wrong, the steward investigates — they don't blame IT.

3. Where Does the Raw Data Live?

7 source systems feeding the Fabric Lakehouse · 2 primary sources (Odoo + Prediktor) · 5 secondary

PRIMARY SOURCES (KPI DRIVERS)

SYSTEM	DOMAIN	WHAT
Odoo 19 SAAS ERP	Quantity & Volume	Delivered m³, stock moves, MO outputs
	Economics	Invoices, COGS, FIFO layers, accruals, landed costs
	Business / Trade	Customers, SO, product groups, sales areas, countries
	OWCR	AR aging, AP aging, inventory valuation
	People	Headcount, payroll cost, department allocation
Prediktor MES / IoT	Operations	Cycle times, temperatures, pressures, batch tracking
	Quality	Scrap events, B-grade %, moisture, hold flags
	OEE	Availability, performance, quality yield per WC

Odoo = economic truth. Prediktor = operational truth. They join in the Silver layer via **lot number / MO reference** to produce cost-per-hour, cost-per-m³, and efficiency KPIs.

SECONDARY SOURCES (CONTEXT & ENRICHMENT)

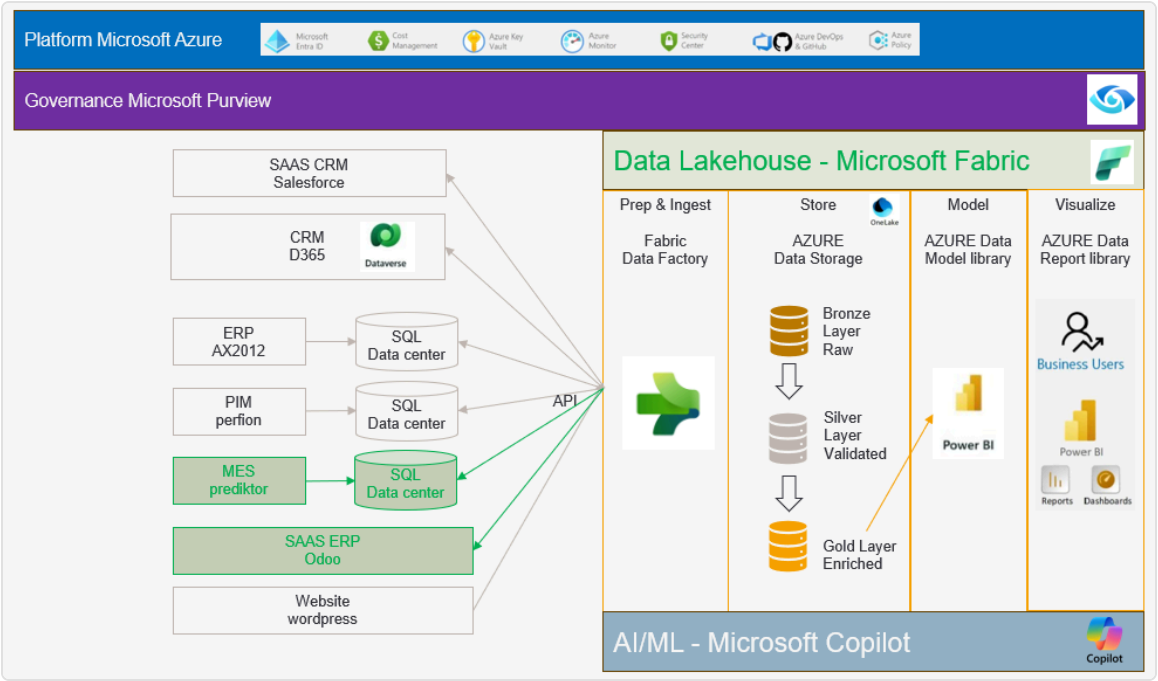
SYSTEM	TYPE	DATA	LAKEHOUSE ROLE
Salesforce	SAAS CRM	Pipeline, leads, opportunities	Commercial enrichment
D365 / Dataverse	CRM	Customer master, contacts	Customer 360° view
AX2012	Legacy ERP	Historical financials (pre-Odoo)	YoY comparison, migration
Perfion	PIM	Product info, specs, images	Product enrichment
WordPress	Website	Web traffic, leads, content	Marketing analytics

Secondary sources enrich, not drive. KPI formulas use Odoo + Prediktor as primary. Secondary sources add context (CRM pipeline for order forecast, AX for historical comparison, Perfion for product specs in reports).

AX2012 is sunset. After Odoo go-live (July 2026), AX becomes read-only history. All new transactions in Odoo. AX data stays in Bronze layer for YoY and migration reconciliation.

4. Data Architecture — Microsoft Fabric Lakehouse

Platform: Microsoft Azure · Governance: Microsoft Purview · AI/ML: Microsoft Copilot



Source: Kebony IT — Data Warehouse Architecture (Microsoft Fabric)

BRONZE LAYER

Raw extraction. Exact copy of source data. Immutable, timestamped. No transformation. "What the system said at that moment."

SILVER LAYER

Validated & joined. Cleaned, typed, deduplicated. Odoo + Prediktor joined by lot/MO. Currency converted. This is where data quality rules run.

GOLD LAYER

Enriched & KPI-ready. Business formulas applied. Aggregations pre-computed. Ready for Power BI consumption. **All KPI logic lives here.**

POWER BI

Read-only dashboards. Semantic model in Azure Data Model Library. Reports & dashboards in Report Library. No formulas — just presentation.

Governance: Microsoft Purview — data catalog, lineage tracking, access policies. Every KPI traces from dashboard → Gold → Silver → Bronze → source system. Full auditability.

AI/ML: Microsoft Copilot — natural language queries on the Gold layer. CEO asks "show me margin by country for KRRS last quarter" and gets an answer. Phase 3 capability.

5. AI-Powered BI — The Next Layer

Microsoft Copilot on the Gold layer · Natural language access to KPIs · From dashboards to conversations

THE SHIFT: DASHBOARDS → CONVERSATIONS

Traditional BI: build a dashboard, train people to use filters and drill-down. If the question isn't on the dashboard, request a new report. Weeks of wait.

AI BI: ask a question in plain language. Get the answer instantly from the same Gold layer that feeds the dashboards. Same data, same definitions, same truth — different interface.

EXAMPLE QUERIES (COPILOT ON GOLD LAYER)

CEO QUESTION	WHAT COPILOT DOES
"Show me GM I by product group for Q3"	Queries Gold layer, returns pivot table + chart
"Which country had the highest margin drop vs last quarter?"	Computes delta, ranks, highlights top mover
"What's our cash conversion cycle trend?"	Pulls DSO + DIO – DPO over 12 months, plots trend
"Why is dryer utilisation down this month?"	Joins Prediktor + Odoo data, identifies root cause (maintenance, batch size, etc.)
"Compare KRRS margin this quarter vs budget"	Pulls actual from Gold, budget from cost version, shows variance

WHY THIS WORKS (AND WHY IT'S SAFE)

SAME SOURCE OF TRUTH

Copilot queries the Gold layer — the exact same data that feeds Power BI dashboards. One version of the truth, whether you read a dashboard or ask a question.

SAME DEFINITIONS

KPI formulas live in the Gold layer, not in Copilot's prompts. "GM I" means the same thing whether computed by the ETL or retrieved by AI. No hallucinated formulas.

GOVERNED BY PURVIEW

Microsoft Purview controls who can access what data. Copilot inherits the same access policies as Power BI. No data leakage, full audit trail.

The Architecture Enables This

Bronze → Silver → Gold is not just a data pipeline pattern — it's the **foundation for AI BI**. Because all business logic lives in the Gold layer (not scattered across dashboards), Copilot has a clean, well-defined dataset to query. **Without the Lakehouse, AI BI doesn't work reliably.**

Phase 3 capability. Requires Gold layer to be mature and validated. Stewards must have confirmed KPI definitions are correct before Copilot serves them to the CEO.

5. Data Steward × Maintenance — Keeping It Alive

KPIs degrade over time if nobody maintains them. The steward's monthly review is the defence.

MONTHLY KPI HEALTH CHECK

#	CHECK	WHAT THE STEWARD VERIFIES
1	**Completeness**	All source data loaded? No missing days / batches?
2	**Cutoff**	All invoices posted? All MOs closed? Accruals booked?
3	**Definition**	Does the KPI still measure what it should? Any scope change?
4	**Reconciliation**	Does the BI number match the source? Cross-check vs Odoo pivot.
5	**Outliers**	Any suspicious spikes or drops? Investigate before publishing.

If a KPI drifts: The steward escalates to IT / data team for a source fix. Never patch data in the BI layer. Never "adjust" in Excel. Fix the root cause in Odoo or Prediktor, then the report self-corrects.

The Maintenance Calendar

M+5 WD: Financial KPIs finalised (revenue, margin, OWCR)
M+3 WD: Production KPIs finalised (output, yield, OEE)
M+10 WD: Full KPI package published to CEO dashboard

CUTOFF RULES BY KPI FAMILY

FAMILY	STEWARD	SOURCE	CUTOFF RULE	MONTHLY CHECK
Commercial	Sales Dir	Odoo invoices	All invoices posted by M+5	Check unposted drafts
Margin	CFO	Odoo COGS + accruals	COGS final after GRNI cleared	Check GRNI aging > 30d
Production	Ops Dir	Prediktor + Odoo MO	All MOs closed by M+3	Check open MOs
Supply Chain	Logistics	Odoo stock / picking	All deliveries validated	Check draft pickings
OWCR	CFO	Odoo AR / AP / inventory	GL closed for period	Reconcile sub-ledgers
People	HR / Ops	Odoo payroll + Prediktor	Payroll run complete	Check headcount vs budget

6. KPI Families — Overview

Six families aligned to the P&L waterfall and operational dimensions

#	FAMILY	WHAT IT MEASURES	PRIMARY USER	SOURCE	STEWARD	DRILL-DOWN
1	**Commercial**	Revenue, volume, pricing, mix, order book, customer base	CEO, Sales	Odoo (invoices, SO)	Sales Director	Country, Product Group, Sales Area
2	**Margin**	GM I, GM II, EBITDA, margin per m³, smoothed SKU margin	CEO, CFO	Odoo (COGS, accruals, analytics)	CFO	Product Group, Country, BU
3	**Production**	Output volume, yield, OEE, scrap, cycle times, cost/m³	CEO, Ops	Prediktor + Odoo (MO)	Ops Director	Planning Family, Work Centre
4	**Supply Chain**	Inventory days, OTIF, lead times, slow movers	CEO, Ops	Odoo (stock, picking)	Logistics Mgr	Product Group, Warehouse
5	**Working Capital**	DSO, DPO, DIO, cash conversion cycle	CEO, CFO	Odoo (AR, AP, inventory)	CFO	Entity, Customer aging
6	**People**	Headcount, cost/m³ produced, labour productivity	CEO, HR	Odoo (payroll) + Prediktor	HR / Ops Dir	BU, Department

Alignment with P&L waterfall: Commercial = top line (Revenue). Margin = GM I, GM II, EBITDA. Production = cost drivers. Supply Chain + OWCR = balance sheet efficiency. People = the human engine.

Analytical drill-down uses the 5 plans already designed in Odoo: Product Group, Cost Group (CM Level), Country, BU, Sales Area. The same dimensions flow into the BI layer.

7. KPI Family: Commercial

Revenue, volume, pricing, and customer metrics · Steward: Sales Director

KPI	DEFINITION	UNIT	FREQUENCY	DRILL-DOWN	CUTOFF / SOURCE
Net Revenue	Posted invoice revenue – credit notes	€ / $	Monthly	Country, Prod Grp, Sales Area	All invoices posted by M+5
Volume Sold	Delivered m³ (from stock moves linked to SO)	m³	Monthly	Country, Prod Grp	All deliveries validated
Average Selling Price	Net Revenue / Volume Sold	€/m³	Monthly	Prod Grp, Country	Computed
Order Intake	Confirmed SO value in period	€	Monthly	Country, Sales Area	SO confirmation date
Order Book	Open SO not yet delivered (value + m³)	€ + m³	Weekly	Country	Snapshot at reporting date
Active Customers	Customers with ≥1 invoice in period	#	Quarterly	Country	Posted invoices only
Price Realisation	Actual ASP vs list price (% of list)	%	Monthly	Prod Grp	Invoice price vs pricelist

Volume normalisation: All volumes in m³ (converted from LM via product's `x_studio_volume_m3`). This is the standard unit for all cross-product comparisons. Board count is secondary (rounded up at 0.95 threshold).

8. KPI Family: Margin

P&L waterfall metrics · Steward: CFO · Aligned with Contribution Margin levels

KPI	DEFINITION	UNIT	FREQUENCY	DRILL-DOWN	CUTOFF / SOURCE
GM I (Material Margin)	Revenue – COGS Direct (wood, chemicals, packaging)	€ and %	Monthly	Prod Grp, Country	COGS from FIFO layers
GM II (Production Margin)	GM I – COGS Indirect (conversion absorption)	€ and %	Monthly	Prod Grp	WC absorption from MO
EBITDA	GM II – SC – Sales – Mkt – Corp – R&D – ESOP	€ and %	Monthly	BU	All allocations posted
Margin per m³	GM I / volume sold	€/m³	Monthly	Prod Grp, Country	Computed
Margin per SKU (smoothed)	Quarterly SKU-averaged margin (Option B+)	€/m³	Quarterly	Prod Grp	After full quarter of FIFO data
Accrual Coverage	Accrual booked vs actual invoices received	%	Quarterly	Type (mkt, royalty, mgmt, rep)	Actual vendor bills matched
Production Variance	Actual cost/m³ vs budget cost/m³ (cost version)	€/m³	Monthly	Family, WC, GL account	MO closed + cost version locked

Option B+ link: Margin per SKU (smoothed) is the quarterly average from FIFO data — no journal entries needed, just a GROUP BY on existing COGS. Gives the CEO fair cross-market comparison without destroying lot traceability.

Variance decomposition: Production Variance splits into price, volume, and efficiency components via the Cost Version framework (budget WC rates × hours vs actual). See *Manufacturing & Costing Architecture* deck.

9. KPI Family: Production

Output, efficiency, and cost metrics · Steward: Operations Director · Source: Prediktor + Odoo

KPI	DEFINITION	UNIT	FREQUENCY	SOURCE	DRILL-DOWN
Output Volume	FG produced (MO completed)	m^3	Weekly	Odoo MO	Planning Family
Yield	FG output m^3 / RM input m^3 (net of scrap)	%	Monthly	Odoo MO	Planning Family
Scrap Rate	Internal scrap + B-grade as % of input	%	Monthly	Odoo MO + Prediktor	Family, scrap type
OEE	Availability × Performance × Quality	%	Monthly	Prediktor	Work Centre
Dryer Utilisation	Actual dryer hours / available dryer hours	%	Weekly	Prediktor	Dryer unit
Cycle Time Variance	Actual hours vs reference hours (from family)	hours / %	Monthly	Prediktor + Odoo family	Family, WC
Cost per m^3 (actual)	Total MO cost / output m^3	€/m^3	Monthly	Odoo MO (FIFO)	Family, cost component
Cost per m^3 (budget)	From cost version family card	€/m^3	Monthly	Odoo cost version	Family

OEE requires Prediktor integration (Phase 3). At go-live, availability and cycle times can be computed from Odoo MO data (start/end timestamps). Full OEE with micro-stops and speed losses requires Prediktor historian data.

Dryer utilisation is the #1 capacity KPI. The dryer is the bottleneck. All throughput planning is expressed in dryer hours (capacity weight = dryer hours / m^3). This KPI tells the CEO if the plant is running at capacity or not.

10. KPI Families: Supply Chain & Working Capital

Inventory efficiency, delivery performance, and cash cycle · Stewards: Logistics Manager (SC) & CFO (OWCR)

SUPPLY CHAIN

KPI	DEFINITION	UNIT	FREQUENCY
OTIF	On Time In Full: deliveries on-time & complete / total deliveries	%	Monthly
Inventory Turnover	COGS / average inventory value	×	Monthly
Slow Mover Exposure	Inventory value with no movement > 90 days	€	Monthly
GRNI Aging	Goods received without vendor bill > 30 days	€	Monthly
Delivery Lead Time	SO confirmation to delivery (avg days)	days	Monthly

Slow Mover Exposure links directly to the FIFO reservation discipline (Option B+). The system proposes old lots first — lots that keep being skipped are slow movers that need attention (downgrade, write-off, or targeted sale).

WORKING CAPITAL (OWCR)

KPI	DEFINITION	UNIT	FREQUENCY
DSO	AR balance / (annual revenue / 365)	days	Monthly
DPO	AP balance / (annual COGS / 365)	days	Monthly
DIO	Inventory value / (annual COGS / 365)	days	Monthly
Cash Conversion Cycle	DSO + DIO – DPO	days	Monthly

Cash Conversion Cycle = The CEO's Cash KPI

How many days of cash are tied up in the business cycle? Lower is better. **DSO** (how fast customers pay) + **DIO** (how long inventory sits) – **DPO** (how long we take to pay suppliers).

PEOPLE (OVERVIEW)

KPI	DEFINITION	UNIT	FREQUENCY
Headcount	Active employees (FTE)	#	Monthly
Labour Cost / m³	Total payroll / output m³	€/m³	Monthly
Revenue / FTE	Net revenue / headcount	€/FTE	Quarterly

11. The Steward Matrix — Who Owns What

The accountability map · One steward per KPI family · Clear source, cutoff, and review cycle

KPI FAMILY	STEWARD	SOURCE SYSTEM	CUTOFF RULE	MONTHLY CHECK	REVIEW DATE	ESCALATION
Commercial	Sales Director	Odoo (invoices, SO)	All invoices posted by M+5 WD	Unposted drafts, missing credit notes	M+6 WD	Finance → IT
Margin	CFO	Odoo (COGS, accruals, analytics)	GRNI cleared, accruals booked, cost version locked	GRNI aging, accrual vs actual, variance review	M+7 WD	Controller → IT
Production	Ops Director	Prediktor + Odoo MO	All MOs closed by M+3 WD	Open MOs, missing cycle times, scrap unrecorded	M+4 WD	Plant Mgr → IT
Supply Chain	Logistics Mgr	Odoo (stock, picking)	All deliveries validated, returns processed	Draft pickings, OTIF anomalies, slow mover list	M+5 WD	Ops Dir → IT
Working Capital	CFO	Odoo (AR, AP, inventory)	GL period closed, sub-ledgers reconciled	AR > 90d, AP > 60d, inventory recon	M+7 WD	Controller → IT
People	HR / Ops Dir	Odoo (payroll) + Prediktor	Payroll run complete for period	Headcount vs budget, cost/m³ trend	M+8 WD	HR → Finance

How the CEO Uses This Matrix

When a KPI looks wrong or raises a question, the CEO goes to the **steward** — not to IT, not to the data team. The steward is the single point of accountability for that number. They know the definition, the source, the cutoff, and the quality status.

CEO DASHBOARD TIMELINE

M+10
Full Package

12. Day 1 Visibility — Odoo Native Dashboards

No blind spot between go-live and Fabric rollout · Odoo delivers operational KPIs from day 1

AVAILABLE AT GO-LIVE (JULY 2026)

Odoo 19 ships with native reporting tools: **pivot tables**, **graph views**, **cohort analysis**, **spreadsheet integration**, and **custom SQL dashboard views**. Not as polished as Power BI, but fully functional — and built on real-time data (no ETL delay).

KPI	ODOO SOURCE	NATIVE REPORT TYPE
Revenue by Area	Invoices (posted)	Custom SQL Pivot
Sales Pipeline	Confirmed SO – invoiced	Custom SQL Pivot
Cash Position	Invoiced – paid + prepayments	Custom SQL Pivot
Order Intake	SO confirmed in period	Sales Analysis (native)
Volume Sold	Delivered m³ via stock moves	Delivery Analysis (native)
AR Aging	Open invoices by due date	Aged Receivable (native)
AP Aging	Open vendor bills by due date	Aged Payable (native)
Inventory Valuation	Stock on hand × FIFO cost	Inventory Valuation (native)
Margin by SKU	Revenue – COGS per product	Invoice Analysis (custom fields)
Margin by Country	Revenue – COGS per partner country	Invoice Analysis (custom fields)
Margin by Customer	Revenue – COGS per partner	Invoice Analysis (custom fields)
Margin by Product Group	Revenue – COGS per analytic plan	Invoice Analysis (custom fields)
Production Output	MO completed volume	Manufacturing Analysis (native)
CRM Pipeline	Opportunities by stage	CRM Pipeline (native)
OTIF	Delivery vs commitment date	Delivery Analysis (native)

ALREADY BUILT — SALES & CASH DASHBOARD

SALES PIPELINE VIEW

Custom SQL pivot: **Invoiced + To Invoice** by Sales Area × Month. Drill-down to customer, then to invoice. Volume in m³ alongside amount. Answers: *"how much did each area sell, and what's in the pipe?"*

CASH POSITION VIEW

Same pivot, cash filter: **Paid + To Cash In + Prepayments**. Answers: *"how much cash came in, how much is outstanding, what prepayments are on the books?"*

MARGIN ANALYSIS — ALREADY IN ODOO

Every invoice carries computed fields: **COGS** (FIFO lot cost or dropship vendor bill), **accruals** (marketing, royalties, mgmt fees, rep commission), **freight**, **warehousing**. Margin = Revenue – all cost layers. Pivot by any dimension: **SKU, customer, country, product group, sales area**.

DRILL-DOWN CAPABILITY

Every pivot row can be expanded: **Sales Area → Customer → Invoice**. Group by month, quarter, or sales rep. Export to spreadsheet for ad-hoc analysis.

The more KPIs in Odoo, the better. Every KPI computed inside the ERP is available in real-time, tagged with the 5 analytic plans, and automatically flows into the Lakehouse when Fabric goes live. No rework, no retroactive tagging, no manual export.

Odoo = Immediate. Fabric = Polished.

The CEO gets **80% of the KPIs on day 1** via Odoo native reports. Fabric adds the remaining 20% (Prediktor integration, cross-source joins, AI queries) and wraps everything in Power BI presentation. But the data foundation and business logic are already in Odoo.

14. Implementation Phasing

From Odoo go-live to full CEO dashboard · Three phases, all delivered by end of 2026

ROADMAP

PHASE	WHAT	WHEN	PRIORITY	DEPENDS ON
Go-live	Odoo configured with 5 analytic plans. All raw data available in the ERP. Stewards appointed.	July 2026	MUST	ERP migration
Phase 2	Microsoft Fabric Lakehouse live. Bronze/Silver/Gold layers populated (nightly). Basic Power BI dashboards: Commercial + Margin + OWCR.	Sep 2026	MUST	Fabric infra, ETL design
Phase 3	Prediktor integration. OEE + Production dashboards. Full KPI package with drill-down. Option B+ smoothed margin view.	Q4 2026	MUST	Prediktor API, Gold layer maturity

Interim (July–Sep 2026): Between go-live and Phase 2, KPIs can be extracted directly from Odoo's native pivot tables and exported to Excel. Not ideal, but sufficient. The analytical plans are in place — the data is tagged correctly from day 1. No retroactive tagging needed.

Critical path: The 5 analytic plans must be seeded at go-live. If data isn't tagged from day 1, it's very expensive to backfill. The BI platform can wait — the data structure cannot.

WHAT'S AVAILABLE AT EACH PHASE

GO-LIVE (JULY 2026)

- ✓ 5 analytic plans active in Odoo
- ✓ All transactions tagged (auto + manual)
- ✓ Odoo native pivot for ad-hoc analysis
- ✓ Stewards appointed, cutoff rules defined
- ⚠ No automated dashboards yet

PHASE 2 (SEP 2026)

- ✓ Fabric Lakehouse live, nightly extraction
- ✓ Commercial + Margin + OWCR dashboards
- ✓ Monthly steward review process operational
- ⚠ Production KPIs from Odoo MO only (no Prediktor yet)

PHASE 3 (Q4 2026)

- ✓ Prediktor data in Lakehouse
- ✓ Full OEE, cycle time, quality dashboards
- ✓ Odoo + Prediktor joined (lot/MO as key)
- ✓ Option B+ smoothed SKU margin (first full quarter)
- ✓ Complete CEO KPI package (all 6 families)
- ✓ Drill-down by all 5 analytic dimensions
